DEEP SOWING OF WHEAT

— The Effect on Root Systems

By S. C. CHAMBERS, M.Sc., Plant Pathologist

In deeply sown wheat crops, the main root system does not originate from the seed, but develops from the under-ground part of the stem approximately 1 to 1\(\frac{1}{2}\) inches below the soil surface.

Deep sowing appears to be an important cause of poor emergence in wheat and care should be taken to seed at the recommended depth of 1 to 1\(\frac{1}{2}\) inches. Nevertheless some growers in drought liable areas, persist in sowing at 2 to 3 inches in the belief that it will encourage a deep root system.

Field observations in deeply sown crops indicate that although some roots arise from the seed, the main system originates from the stem an inch or so below the soil surface.

However, to obtain more precise information, the following experimental work was undertaken.

**EXPERIMENTAL**

Plump well-graded seed of the wheat variety Gabo was sown by hand at depths of 1, 2, 3 and 4 inches in small plots at South Perth on July 5, 1962.

The experimental design was a simple randomised plot system which included six replications of the four sowing depths. Each plot contained 100 seeds sown in 10 rows of 10 with a space interval of 2 inches between seeds.

The root systems were examined eight weeks after seeding to determine the depths of origin.

**RESULTS**

Emergence was markedly reduced in the deeply sown plots and only 60 plants could be examined as the maximum standard number for each plot. An analysis of the depths at which the main root systems originated, in relation to depths of seeding is contained in Table 1.

**TABLE 1**

**DISCUSSION**

The root system of the wheat plant may be differentiated into two parts, that is the primary and secondary root systems. There are five (sometimes six) primary roots which arise from the seed soon after
The primary root system consists of five roots. The single central root develops first and is followed by two pairs of lateral roots on germination (Fig. 1). The secondary roots develop subsequently from the underground part of the stem to form the bulk of the root system (Fig. 2).

From the results it is evident that deep sowing only caused a slight increase in the depth of origin of the secondary roots (Fig 3). However, whereas these roots originated ¼ inch above seed sown in 1 inch, the distance was increased to 2½ inches by sowing seed 4 inches deep.

Thus it will be seen that deep sowing causes unnecessary elongation of the stem between the seed and the secondary roots. As a result, the food reserves of the grain are taxed severely and the seedling may even fail to emerge. In this experiment sowing at 4 inches reduced emergence by almost 40 per cent.

It is apparent there is little value in sowing crops deep to produce a deep root system. This is further emphasised by field observations of secondary roots developing within an inch of the surface in older plants, irrespective of planting depth.
In many cases, later secondary roots even arise from the first node or joint above the surface (Fig. 2).

Today's Greatest Value Fencing
and the answer to your fencing problems

NOW MADE IN W.A.
Tried and proven Double-Lock fencing has been recognised and used extensively throughout the U.S.A. for many years. Now it is made in W.A. by Skinners using the exclusive Double-Lock joint — the joint that cannot slip.

The perfect partner for your Double-Lock fence
SKINNER'S HALF ROUND POST
CURVED for EXTRA strength — DRILLED POINTED and PAINTED ready for erection. Made from the world's best steel and designed to suit all types of fencing. Sizes 4ft. 6in. and 5ft. 6in. in bundles of 20.

The Fence with DOUBLE Strength
Double-Lock is made to last longer — to do a better job on all types of properties for all types of stock — to resist extremes of heat and cold through the exclusive Double-Lock tension curve — to look neater and withstand buffeting — and to save you time, work and money. The Double-Lock with its double strength, is today's greatest value fencing and an investment for tomorrow. Choose from four types — sheep, lamb, cattle, pig.
