A NUMBER of our major weed pests including Cape tulip and double gee are native to South Africa. It is not surprising, therefore, that Gorteria, recently recorded for the first time in Western Australia, also comes from that country.

During the summer of 1964, some burr-bearing plants found along the roadside between Moora and Miling were identified as *Gorteria calendulacea* an annual species belonging to the thistle family. The spiny, burr-like seed heads drew attention to the dry plants. A close inspection during the winter revealed a number of growing plants scattered along the roadside and also extending into an adjoining paddock. Later a more extensive area was located at Bindi Bindi where the weed occurred in patches over approximately ten acres in the vicinity of the sports ground. All areas found were sprayed with good results although difficulty was experienced in locating plants among other herbage.

As Gorteria had not been recorded previously in Australia its importance as a weed cannot be assessed from experience. The dry seed heads, with their spiny bracts resemble those of cockspur thistle and the two plants could be comparable as weeds. The seed heads would undoubtedly adhere to wool although not having the hooked spines of Bathurst burr.

Any new weed introduction must be regarded with concern and farmers, particularly in the Moora and Miling districts, should maintain a watch for Gorteria. The illustrations and following description should assist with its identification:

The plants usually grow to a height of 12-18 inches with numerous spreading branches from rather woody stems. The leaves are up to 3 inches long, dark green above, paler below with a lobed or toothed...
margin. They are narrowed at the base into a rather broad leaf stalk. The stems and leaves are covered with rigid hairs, making them rough to the touch. The flowers are yellow and are borne in heads at the ends of the branches. They are surrounded by a number of narrow green protecting bracts, and as the flowers mature, these bracts harden and bend outwards to form a rigid spiny burr enclosing up to eight seeds. The burrs readily fall to the ground and the spines assist their spread by stock and machinery.
Now! 1 Pump does 2 jobs!

BLASTS FIRES
FILLS TANKS

125 P.S.I.*
WITH 3/16" NOZZLE!

6,600 G.P.H.
WITH 5ft. SUCTION!

SOUPACIFIC
ENG.

FIRE QUENCHER!

Here now is the perfect firefighting combination! The South Pacific FIRE QUENCHER gives you all the pressure you need to blast tree-top fires and fog spray ground fires... plus a handy high volume output for other jobs such as tank filling and de-watering.

2 STAGES, with twin impellers placed back-to-back give greater efficiency, guarantee a smoother-running pump.

SELF PRIMING and completely trouble free. Most dependable pump you'll ever own.

DIRTY WATER is no problem. Handles mud and grit better than any other firefighter.

The South Pacific Fire Quencher is approved by firefighting authorities. We'll gladly demonstrate its unmatched performance.

Yet we didn’t see a bag of wheat.

("Because grain was bulk handled and stored in silos on the farm. For segregation of grain, the chance to truck when transport prices are low, and rail transport worries are nil. What's more, the silos can be put to good use later on to store valuable fodder.")

That's what they're saying in Gunnedah. Where they're producing as much wheat as the next, and more than most. Gunnedah farmers are finding they can't get their wheat away fast enough. Local storage facilities can't cope with the intake of grain. Rail transport can't keep up with the wheat harvest, either. And each year of late there's been a record-breaking harvest. What's happening? Last year one farmer we know paid a man £5 a day for 3 weeks, 2 days, to move his 2 trucks up the waiting queue at the railway siding. This year the same farmer has 5 x 3,700-bushel silos on his farm. Safe, dry wheat and no worries. Every farmer we spoke to agreed silos have the decided advantage of on-the-farm storage, segregation of grain, and safe, certain storage against fire, flood, drought. And now that there are more sheep than ever before, 50% of farmers who install silos are using them exclusively for fodder storage, as an assurance against the constant, unpredictable threat of drought. Lysaght silos pay for themselves in 3 years, besides being a very worthwhile tax deduction. Lysaght on-the-farm silos mean peace-of-mind grain storage for the next 50 years. And more.
